

A seamless cloud-connected platform — from the moment a module is installed to the moment a vehicle is sold.

01

INSTALL

Plug the DOVA module into the OBD-II port — the same port on every U.S. vehicle since 1996. No OEM permission. No special tools. Install time: under one hour.

02

AUTO-ENROLL

The module reads the VIN at power-on and self-enrolls in the DOVA cloud. No technician setup. No make or model programming. Live in under 60 seconds.

03

FLEET SETUP

Your team configures the web dashboard — assign roles, set permissions, define geofences. Each user sees only the vehicles they're cleared to access.

04

ACCESS REQUEST

An authorized user opens the DOVA mobile app, selects a vehicle, and taps to request access. That request goes to the cloud — never directly to the hardware.

05

THREE-GATE CHECK

The cloud runs three checks: identity verified via 2FA, user role confirmed, manager approval received if required. All must clear before any command is sent.

06

VEHICLE UNLOCKED

Only after all three gates pass does the cloud send an encrypted cellular command to the module, which triggers the lock. No shortcut. No bypass. No exceptions.

07

ACCESS LOGGED

Every event is permanently recorded: who, when, GPS coordinates, and a full diagnostic snapshot — odometer, fuel, charge, tire pressure, and active fault codes.

08

VEHICLE SELLS

When the vehicle is sold, you choose what happens to the DOVA module. See the Post-Sale Options guide for every choice — for your business and your customer.
